2

There were no operating systems

"Preparing ENIAC for a series of runs was an incredibly involved process. First, detailed instructions had to be written defining the problem and a procedure for solving it. These instructions were programmed by adjusting switches manually and inserting thousands of cables into as many as forty large plug boards. A team of five operators might work several days on the external wiring and many more days searching for errors and correcting them."

— *Breakthrough to the Computer Age*, Harry Wulforst, Charles Scribner's & Sons Pub., 1982

4

Ferrite Core Memory

- Fast, random-access memory
 - Non-volatile
 - Write-after-read to preserve bit
- First used in MIT's Whirlwind-1
 - 1953
 - 32x32x16 bits
- Used through ~1980

5

Late 1940s – 1950s

- Stored program concept: reload a program
- Reusable code ("subroutines")
- IBM SHARE (Society to Help Alleviate Redundant Effort)
- The OS emerges
 - I/O Control System (IOCS): Common I/O routines for device access
 - Precursor to *device drivers*
 - Batch systems (1956)
 - "Control cards" after a deck of punched cards to terminate one job and prepare for the next
 - Programmatic transition to reduce overhead of starting new jobs
 - Branch to a location in the OS that would cause the next program to get loaded and run
 - Job control languages to define resource needs

6

The Interrupt

- 1951 – UNIVAC I: exception handling
 - Transfer control on arithmetic overflow
- 1956 – UNIVAC 1103A
 - Hardware interrupt support
 - Interrupt writes PC to memory location & transfers control to an Interrupt Service Routine

7

1960s

- Goal: improve throughput
 - Use every possible second of CPU time
- **Multiprogramming**
 - Keep several programs in memory at once; switch between them
 - Works because of the speed mismatch between I/O and CPU
- 1961: **Time sharing**: preemption
 - CTSS (Compatible Time-Sharing System): Process scheduling
- 1962: the **System Call** (Atlas I Computer, Manchester)
 - Privileged & unprivileged modes

8

1960s

- Interactive access
- User accounts and passwords
- Direct storage access (file systems)
- Transaction processing systems (SABRE)
 - IBM & American Airlines

9

1960s

- 1961: DEC PDP-1 – first minicomputer (\$125,000+)
- 1964: IBM System/360
 - PCP/360: sequential jobs (batch)
 - MFT: Multiple job system, fixed number of tasks
 - MVT: Multiple jobs, variable number of tasks (direct memory)
 - Direct Address Translation (precursor of **virtual memory** & the **Memory Management Unit**)
 - **Channels**: specialized processors for transferring data between main memory and an I/O device (precursor of **DMA**)

10

December 9, 1968: The Mother of All Demos

- Douglas Engelbart
Stanford Research Institute (SRI), Augmentation Research Center
- Presented at Fall Joint Computer Conference
- Introduced
 - Computer mouse
 - Windows
 - Video conferencing
 - WYSIWYG word processing (with cut & copy) & embedded objects
 - Collaborative editing
 - Version control
 - Hypertext

11

1964-1970: Multics

- **Memory mirrored** onto the disk and available via the file system
- **Dynamic linking** for code & data segments
- **Interprocess communication** via shared segments
- **Multiprocessor support**
- **On-line reconfiguration** of system HW without downtime
- **Hierarchical security model** using protection rings
- **Hierarchical file system** with arbitrary file names
- **Symbolic links**
- Command processor **not** part of the operating system
- Written in a **high-level language**
 - EPL, a subset of PL/1 with extensions
- **I/O redirection** to files and programs ("pipes")

12

Late 1960s – 1970s

- 1970s: UNIX
 - Portable operating system
 - Written in an efficient high level language (C)
 - The UNIX programming environment: shell, pipes, “tools”

1972: Virtual Machines

- 1972: **Virtual Machines (VM/370)**
 - Run multiple operating systems on one machine
 - Each “machine” presents the same System/370 architecture
- Hypervisor
 - Control program that runs on the physical hardware and creates the virtual machines
 - Intercepts & interprets all I/O operations and privileged instructions
 - Partitions memory

1973: Xerox Alto

- A *personal* computer (dedicated to one user)
 - Desktop UI metaphor and a mouse
 - Inspired by Douglas Englebart’s On-Line System
- Specs
 - T1 bit-slice processor
 - 128-512 KB RAM
 - 2.5MB removable hard disk
 - Ethernet
 - B&W CRT
 - 3-button mouse
 - Small fridge-sized cabinet
- Inspired the Mac & Microsoft Windows

1971 - 1975

- Microprocessors emerge
 - Intel 4004 → 8008 → 8080
 - Zilog Z-80, MOS Technology 6502, Motorola 6800, 6809
 - CP/M: dominant OS for 8080 family of machines
 - CCP: command interpreter
 - BDOS: file operations, printing, and console I/O
 - BIOS: character I/O, disk sector read/write

Initial cost
8080: \$360
6502: \$25

Late 1970s: Home PCs

- 1975: Early PCs – targeted at hobbyists
 - Connect your own teletype or use a front panel
 - Build it from a kit
 - Write your own OS drivers
- 1977: Ready-to-use personal computers
 - Apple II
 - Commodore PET
 - Radio Shack TRS-80 Model I
 - Followed by:
 - Atari 400, Atari 800, TI-99/4A, Commodore Vic 20, Commodore 64, ...

1980s

- 1981: IBM PC
 - Open architecture; Microsoft OS
 - Only proprietary component was the **BIOS**
- 1982: BIOS was reverse engineered
 - PC clones (Compaq, Columbia, Dell, HP, ...)
- 1984: Apple Macintosh

1980s

- **Client-server networking**
 - Personal workstations
 - Network file systems
- **1985: Intel 80386**
 - Virtual memory with paging
 - Virtual 8086 mode for multiple legacy programs

February 2, 2015

© 2014-2015 Paul Krzyzanowski

19

1990s

- **1990: Windows 3.0**
 - Takes advantage of virtual memory provided by 80386
- **1993: Windows NT**
 - New OS built from scratch
- **Open Source Operating Systems**
 - Linux, FreeBSD, NetBSD, OpenBSD
- **1995: Windows 95**
 - Built-in Internet support (networking usually via modem)

February 2, 2015

© 2014-2015 Paul Krzyzanowski

20

1990s

- PCI bus: **Plug & Play hardware**
 - Adding hardware becomes easy
- Laptops become mainstream: *power usage is important*
- **1993: NCSA Mosaic** – the web browser
- **Network PC, thin clients**
 - Failed ... but resurrected with the Google Chromebook

February 2, 2015

© 2014-2015 Paul Krzyzanowski

21

2000s

- **PC-based machine virtualization**
 - Virtualization support added by Intel & AMD (2006)
 - Virtual machine migration
- **Cloud computing, on-demand data centers**
- **Security**
 - Hardware authentication, Storage encryption, digital rights management: Trusted Platform Module
 - Personal firewalls
 - Address space layout randomization

22

Multi-core Architectures

- **2005: Intel Introduces dual core Pentium D**
 - 90nm process – Pentium Extreme Edition
 - 230 million transistors
 - 2 MB L2 cache
- **Late 2014: Intel Haswell-E i7-5960X**
 - 8 Cores
 - Hyperthreading
 - 2.6 Billion 22nm tri-gate 3-D transistors
 - 2133 MHz DDR4 memory interface
 - 20 MB L3 cache (shared across cores)

February 2, 2015

© 2014-2015 Paul Krzyzanowski

23

2000s

- **Focus on mobility**
 - Tablets
 - 1991 AT&T EO Personal Communicator
 - 1999: Microsoft Tablet PC
 - 2010: Apple iPad
 - PDAs → smartphones
 - iOS, Android, BlackBerry OS, Windows Mobile
- **Increased focus on embedded systems**
 - Machine-to-machine (M2M), Internet of Things, Arduino, ...
- **Cloud computing**
 - Large scale data centers, reconfigurable virtual machines

The Operating System

February 2, 2015

© 2014-2015 Paul Krzyzanowski

25

What is an operating system?

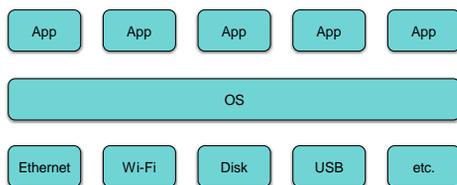

- The first program
- A program that lets you run other programs
- A program that provides controlled access to resources:
 - CPU
 - Memory
 - Display, keyboard, mouse
 - Persistent storage
 - NetworkThis includes: naming, sharing, protection, communication
